Patent No. 6180768

GENERAL INFOMATION:

APPLICANT: MAERTENS, GEERT

APPLICANT: STUYVER, LIEVEN

TITLE OF INVENTION: NEW SEQUENCES OF HEPATITIS C VIRUS GENOTYPES

TITLE OF INVENTION: AND THEIR USE AS PROPHYLACTIC, THERAPEUTIC AND DIAGNOSTIC

TITLE OF INVENTION: AGENTS

NUMBER OF SEQUENCES: 207

CORRESPONDENCE ADDRESS:

ADDRESSE: ANDLD, WHITE & DURKEE

STREET: P.O. BOX 4433
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The invention relates to a mosaic protein, comprising a plurality of annologous antigenic peptides from different genotypes of a species. The antigenic peptides are from nucleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosaic protein is also provided. The method is designated restriction endonuclease assisted are useful for detecting a hepatitis infection in an individual. The mosaic gene and protein is also useful for vaccination against infection, especially hepatitis C. The method of synthesizing the artificial gene and the resulting mosaic protein improve the sensitivity, spectrum of immunoreactivity, and antigen specificity of enzyme immunoassays. This provides improved detection of hepatitis C virus. Sequences AAVO6673-681 represent amino acid sequence of each monomer

Isolated cDNA sequences are used for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, lymphocytes or other mononuclear cells. The antibodies may be used in the prevention of HCV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DNA and amino acid sequence of HCV envelope 1 and core proteins -used to determine HCV genotype and as vaccines against HCV infection

capsid non-A,

```
Hepatitis C virus (HCV) amino acid sequence. They represent the beginning of the HCV open reading frame to amino acid 38 and encompass the "common" sequence. These peptides are contained in the capsid protein of the virus and themselves contain epitope groups. These peptides can be used in immunoassays for HCV antibodies in the diagnosis of non-A, non-B hepatitis (NANBH), and in competitive inhibition assay for detecting HCV specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hepatitis C virus; HCV; open reading frame; "common" sequence; capsid protein; epitope; immunoassay; antibody; diagnosis; NANBH; non-A, non-B hepatitis; competitive; inhibition assay.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequences given in AAR30665-89 represent fragments of the Hepatitis C virus (HCV) amino acid sequence. They represent the beginning of the HCV open reading frame to amino acid 38 and encompass the "common" sequence. These peptides are contained in the capsid protein of the virus and themselves contain epitope groups. These peptides can be used in immunoasasys for HCV antibodies in the diagnosis of non-A, non-B hepatitis (NANBH), and in competitive inhibition assay for detecting HCV specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hepatitis C virus; HCV; open reading frame; "common" sequence; capsid protein; epitope; immunoassay; antibody; diagnosis; NANBH; non-A, non-B hepatitis; competitive; inhibition assay.

The present sequence represents a Hepatitis C virus (HCV) protein sequence from the disclosure of the present specification. The present specification describes a chimeric HCV peptide antigen which comprises at least 2 peptide epitope regions from the HCV polypeptide core region, 2 peptide epitope regions from the NS3 region and at least 2 peptide epitope regions from the NS3 region and at specifically with an antibody produced by a human infected by HCV. The peptide can detect a wide range of HCV infections with high sensitivity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New chimeric peptide antigen derived from hepatitis C virus protein - useful for detecting HCV infections
                                                                                                                                                                  Hepatitis C virus; HCV; chimeric; antigen; detection; core region;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        antigenic; nucleocapsid; p21 protein; alpha-helical; immunogen; antibody; hepatitis C virus; epitope; N-terminal fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Hepatitis C virus p21 protein N-terminal fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   92.0%; Score 138; DB 19;

                                                                                                                                                                                                                                                                        Gaps
The sequences given in AAR30665-89 represent fragments of the Hepatitis C virus (HCV) amino acid sequence. They represent the beginning of the HCV open reading frame to amino acid 38 and encompass the "cormon" sequence. These peptides are contained in the capsid protein of the virus and themselves contained in the capsid protein of the virus and themselves contain epitope antibodies in the diagnosis of non-A, non-B hepatitis (NANBH), and in competitive inhibition assay for detecting HCV specific
                                                                                                                                                                                                                                                                        ö

The invention relates to a peptide, which is recognised by antibodies against amino acids 2.45 at the N-terminus of the core (or nucleocapsid) p21 protein of hepatitis C virus (HCV), or its variants. The peptide has a tertiary structure consisting of two alpha-helical fragments, almost perpendicular to each other in space, connected by a junction peptide. Excluded are all proteins and peptides comprising, or consisting of, the N-terminal part of p21 (starting from amino acid 1 or 2). Also new are (1) monoclonal or polyclonal antibodies produced using the peptide as an immunogen and (2) complex consisting of the peptide specifically bound to some other molecule, particularly peptide or nucleotide fragments or functionalised aromatic compounds. The peptide is used (1) as immunogen for generating and unithodies and (1) for detecting and quantifying either antibodies against p21 or HCV-derived mRNA (by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              prevent HCV infections. The present sequence represents the N-terminus the core p21 protein of hepatitis C virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Monoclonal antibodies useful for detecting and/or quantifying hepatitis
                                                                                                                                                                                                                                                                                                                                                                                                                                 quantifying either antibodies against p21 or HCV-derived mRNA (by complex formation). Antibodies are used correspondingly to detect HCV crelected antigens. The peptide and antibodies may also be used to treat.
                                                                                                                                       nseq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present peptide, designated $426, corresponds to residues 2 to 45 of the N-terminus of the human hepatitis C virus (HCV) core protein. It is an immunodominant region containing conformational type epitopes and linear type epitopes. It manifests an immunoraactivity with all the sera of individuals or blood samples infected with HCV and which possess antibodies directed against the core protein. An amino acid may be substituted for homologous amino acids and side chains and peptide bonds may be modified. For example, L-amino acids may be replaced by D-amino acids, amine groups may be acetytated, and so on. The native antigenic sequence and its antigenic derivatives may be used for detection of hepatitis C virus and for raising antibodies against the virus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polypeptides that bind to anti-hepatitis C virus antibodies, useful for diagnosing and preventing hepatitis C infections
                                         Peptides AAY26949-Y26955 represent peptide epitopes derived from the N-terminus of the hepatitis C virus core protein. The peptides are used to generate monoclonal antibodies or antibody fragments specific for hepatitis C virus (HCV) core protein. The monoclonal antibodies are used for early diagnosis of HCV infections, especially by two-antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; hepatitis C virus; HCV; immunogen; antigen; antibody; virucide; hepatotropic; anti-inflammatory; virus detection; vaccine.

The sequences given in AAR25929-30 and AAR29534-42 represent various clones of the polypeptide core-envelope region of the Hepatitis C Virus (HCV) gene of the invention. These sequences were isolated from the serum of a patient suffering from hepatitis C (HC). The RNA sequences encoding these peptides were converted into cDNA using transcriptase in the presence of one of the primer sequences given in AAQ3540-46. The cDNA sequences isolated represent different alleles of the same region of the HCV gene. The entire HCV protein (see AAR29527) is useful in the development of a diagnostic method which is more accurate and effective than conventional ones, in the detection of antibodies raised against a wide range of HCVs which have been hardly detected before. The complete gene may be used in convening system for a substance capable of specifically supressing or controlling a proteolytic processing of a precursor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Clone; polypeptide; core-envelope; region; Hepatitis C; Virus; HCV; HC; cDNA; transcriptase; primer; allele; diagnostic; antibody;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is the 45 N-terminal amino acids of the core protein of the human hepatitis C virus (HCV). The sequence is an immunodominant region containing conformational type epitopes and linear type epitopes. It manifests an immunoreactivity with all the sera of individuals or blood samples infected with HCV and which possess antibodies directed against the core protein. An amino acid of the present sequence may be substituted for homologous amino acids and side chains and peptide bonds may be modified. For example, L-amino acids may be replaced by D-amino acids, amine groups may be acetylated, and so on. The present antigenic sequence and its antigenic derivatives may be used for detection of hepatitis C virus and for raising antibodies against

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequences given in AAR25929-30 and AAR29534-42 represent various clones of the polypeptide core-envelope region of the Hepatitis C clones of the polypeptide core-envelope region of the Hepatitis C virus (HCV) gene of the invention. These sequences were isolated from the serum of a patient suffering from hepatitis C (HC). The RNA sequences encoding these peptides were converted into cDNA using transcriptase in the presence of one of the primer sequences given in AAG32540-46. The CNA sequences isolated represent different alleles of the same region of the HCV gene. The entire HCV protein (see AAR29527) is useful in the development of a diagnostic method which is more accurate and effective than conventional ones, in the C detection of antibodies raised against a wide range of HCVs which have been hardly detected before. The complete gene may be used in an in vitro screening system for a substance capable of specifically substance of the processing of a precursor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Clone; polypeptide; core-envelope; region; Hepatitis C; Virus; HCV; HC; cDNA; transcriptase; primer; allele; diagnostic; antibody; supress; control; proteolytic processing; precursor.
                                                                                                                                                                                                                                                                                                                                                                                                                                      New hepatitis C virus gene and its encoded protein - used for diagnosing and vaccinating against hepatitis C virus infections

The sequences given in AAR25929-30 and AAR29534-42 represent various clones of the polypeptide core-envelope region of the Hepatitis C clones of the polypeptide core-envelope region of the Hepatitis C virus (HCV) gene of the invention. These sequences were isolated from the serum of a patient suffering from hepatitis C (HC). The RNA cequences encoding these peptides were converted into CDNA using transcriptase in the presence of one of the primer sequences given in AAO32540-46. The CDNA sequences isolated represent different in AAO32507. Is useful in the development of a diagnostic method which is more accurate and effective than conventional ones, in the detection of antibodies raised against a wide range of HCVs which catection of antibodies raised against a wide range of HCVs which can be hardly detected before. The complete gene may be used in an in vitro screening system for a substance capable of specifically supressing or controlling a proteolytic processing of a precursor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New hepatitis C virus gene and its encoded protein – used for diagnosing and vaccinating against hepatitis C virus infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Length 55;

```
Secies: hepatitis C virus

N; Contains: core protein
C; Species: hepatitis C virus
A; Aariety, genotype 2, N2
C; Date: 19-May-1994 #sequence_revision 26-Jul-1996 #text_change 17-Nov-2000
C; Accession: 841353
R; Van Doorn, L.J; Kleter, G.E.M.; Brouwer, J.T.
Submitted to the EMBL Data Library, January 1994
A; Description: Analysis of hepatitis C virus genotypes 1 to 5 by LiPA.
A; Accession: 841353
A; Molecule type: genomic RNA
A; Residues: 1-108 </NA>
A; Residues: 1-108 </NA>
A; Residues: C virus genome polyprotein
C; Superfamily: hepatitis C virus genome polyprotein
C; Superfamily: hepatitis C virus genome polyprotein
C; Keywords: capsid protein; core protein; polyprotein
F; 1-108/Product: core protein #status predicted 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nicontains: core protein

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   polyprotein -

genome polyprotein - hepatitis C virus (genotype 1, N6) (fragment)
N;Confrains: core protein
C;Species: hepatitis C virus
A;Variety: genotype 1, N6
C;Date: 19-May-1994 #sequence_revision 26-Jul-1996 #text_change 17-Nov-2000
C;Accession: 341348
R;Van Doorn, L.J.; Kleter, G.E.M.; Brouwer, J.T.
submitted to the EMBL Data Library, January 1994
Persoription: Analysis of hepatitis C virus genotypes 1 to 5 by LiPA.
Ference number: $41341
ccession: $41348

Genomic characterization and mutation rate of hepatitis C virus
'Genomic characterization and mutation rate of hepatitis C virus
isolated from a patient who contracted hepatitis during an epidemic
of non-A, non-B hepatitis in Japan.";
J. Gen. Virol. 73:2725-2729(1992).
I. SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Hepatitis C virus (isolate HCV-KF) (HCV).

-!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDOPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION. NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
-!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE CONSIGNS OF TWO PROTEIN MAY DIXCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN A ND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MANA.

01-AGG-1992 (Rel. 23, Last sequence update)
15-52P-2003 (Rel. 24, Last annoctation update)
Genome polyprotein (Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein El (GP32) (GP35); Envelope glycoprotein E2 (GP68) (GP70) (MS1); Protein P7; Nonstructural protein NS2 (P21)
(EC 3.4.22.-); Protease/halicase NS3 (P70) (Hepacivirin)
(EC 3.4.21.98); Nonstructural protein NSA (P4); Nonstructural protein NSAB (P27); Nonstructural protein NSAB (P56); Nonstructural protein NSAB (P56); Nonstructural protein NSAB (P65) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
Hepatitis C virus (Isolate BK) (HCV).
                                                                                                                                                                                                                                                                                                                                                                                                          CAPSID PROTEIN C (POTENTIAL).
MATRIX PROTEIN (POTENTIAL).
MAJOR ENVELOPE PROTEIN E (POTENTIAL).
NONSTRUCTURAL PROTEIN NSJ/E2 (POTENTIAL).
NONSTRUCTURAL PROTEIN NS2 (POTENTIAL).

Genome polyprotein [Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein El (GP32) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (NS1); Protean P7; Nonstructural protein NS2 (P21)
(EC 3.4.29-.); Protease/hellcase NS3 (P70) (Hepacivirin)
(EC 3.4.21.98); Nonstructural protein NS4A (P4); Nonstructural protein
NS4B (P27); Nonstructural protein NS5A (P56); Nonstructural protein
NS5B (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 X-RAY CRYSTALLOGRAPHY (2.2 ANGSTROMS) OF 1192-1657.

SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1 AND E2 THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA. PTM: THE STRUCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED BY PROTEOLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASES. SIMILARITY: THE NS2 PROTEASE BELONGS TO PEPTIDASE FAMILY U39. SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SIMILARITY).

"Nucleotide sequence of the genomic RNA of hepatitis C virus isolated from a human carrier: comparison with reported isolates for conserved and divergent regions.";

J. Gen. Virol. 72:2697-2704(1991).

-I. FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLOTION.

-I. CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1.

CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate
                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

28-FEB-2003 (Rel. 41, Last annotation update)
Genome polyprotein [Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein E1 (GP32) (GP35); Envelope glycoprotein E2 (GP68) (GP70) (NS1); Protein P7: Nonstructural protein NS2 (P21) (EC 3.4.22.-); Protease/helicase NS3 (P70) (Hepacivirin) (EC 3.4.21.98); Nonstructural protein NS48 (P27); Nonstructural protein NS58 (P27); Nonstructural protein NS58 (P27); Nonstructural protein NS58 (P50); Nonstructural protein Hepatitis C virus (1solate HC-38) (HCV).
                                                                                                                                                                                                                                                                                                                                                                                                MEDLINE-92230232; PubMed-1314459; Okamoto H., Lizuka H., Tanaka T., Okamoto H., Kurai K., Okada S.-I., Yamamoto K., Lizuka H., Tanaka T., Fukuda S., Tsuda F., Mishiro S.; **Full-length sequence of a hepatitis C virus genome having poor penology to reported isolates: comparative study of four distinct genotypes.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        VITOLOGY 188:331-341(1992).

--- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

--- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 postition, Cys or Thr in P1 and Ser or Ala in P1'.

--- CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (RNA)(N).
SUBUNT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY
LIPOPROFIEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         InterPro; TPR001490; HCV_NS4b.

POTENTIAL).
                                FUNCTION: THE SMALL PROFEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RRA REPLICATION.

CATALYTIC ACTIVITY: HYDROLYSIS OF four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1.

CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + (RNA)(N).

SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROFEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN CAND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polyprotein; Glycoprotein; Transferase; RNA-directed RNA polymerase;
"The Talwanese hepatitis C virus genome: sequence determination and mapping the 5' termini of viral genomic and antigenomic RNA."; Virology 188:102-113(1992).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Envelope protein; Helicase; ATP-binding;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Transmembrane; Nonstructural protein; Hydrolase; Serine protease;

Genome polyprotein [Contains: Capsid protein C (Core protein E2 (GP68) (GP70) (NS1); Protein E1 (GP32) (GP55); Envelope glycoprotein E2 (GP68) (GP70) (NS1); Protein Rel (GP32) (Hepacivirin)
(EC 3.4.21.98); Nonstructural protein NS4A (P4); Nonstructural protein NS5B (PC2); Nonstructural protein NS5A (PS6); Nonstructural protein NS5B (PC5) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
Hepatitis C virus (isolate HC-J1) (HCV).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       VILUE RES. 23:99-53(1992).

-!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

-!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 postition, Cys or Thr in P1 and Ser or Ala in P1'.

-!- CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SEQUENCE FROM N.A.

SUBURIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                   (POTENTIAL). (POTENTIAL). (POTENTIAL).
